

NavCad®

“The scope of NAVCAD is enormous, and should be a required acquisition of all design offices...” THE NAVAL ARCHITECT

What is NavCad?

NavCad is a software tool for the prediction and analysis of vessel speed and power performance. It also provides for the selection of suitable propulsion system components – engines, gears and propellers. NavCad’s basic capabilities can be summarized as:

- Bare-hull resistance
- Added resistances
- Design guidance for drag reduction
- Hull-propulsor interaction
- Steady-state propulsion analysis
- Propeller selection
- Supplemental analyses

Who should use NavCad?

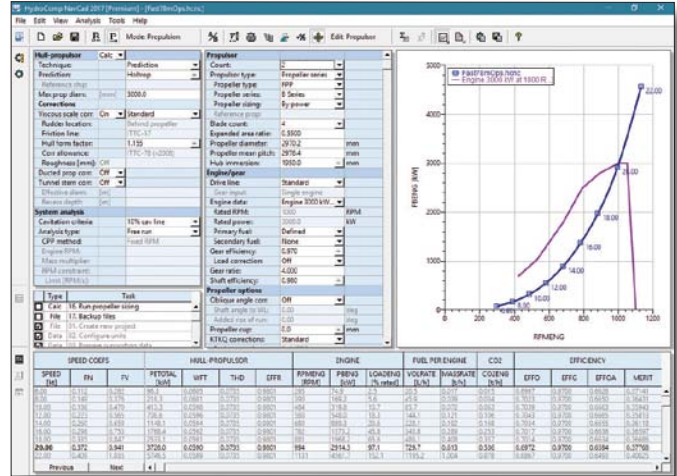

Naval architects, marine engineers, hydrodynamicists and researchers in shipyards, design consultancies, equipment manufacturers, navies and research institutions all rely on NavCad.

What vessels can I evaluate with NavCad?

NavCad can be used for virtually every type of displacement, semi-displacement and planing craft, barge, sailboat, catamaran – even submarine and SWATH. Towing and free-running analyses are supported, as are open and ducted propellers, waterjets, and advanced propulsors (such as contra-rotating propellers).

What makes NavCad different?

NavCad is unlike any other resistance and propeller program. Not limited to a few routines for the prediction of one or two aspects of performance, NavCad provides a complete platform for the steady-state equilibrium analysis of performance from hull to engine. Features such as the Minimum Hull Drag analysis provide designers with powerful tools to optimize hull forms.

How accurate is NavCad?

Prediction accuracy is insured by offering a) the largest available suite of prediction methods (over two dozen for bare-hull resistance alone), b) compatible components between methods, c) calculations built from contemporary state-of-the-art methodologies, d) a complete analysis environment where critical components (like shallow water resistance, for example) cannot be forgotten, e) user guidance such as the Method Expert prediction method ranking system, and f) dedicated validation, testing and internal R&D.

What is the Premium Edition?

NavCad Premium is a “power user” feature upgrade (www.navcad-premium.com). The Premium Edition includes the following capabilities and upgrades:

- Scripting (macro) API
- Connect as resistance and propulsion solver
- Operating modes analysis
- Wave theory resistance prediction
- Dual-fuel and emission predictions
- Floating network license
